

XR Shoulder Rt :

There is a very large destructive lesion in the right humeral neck and upper shaft with extensive soft tissue calcification and periosteal reaction. There is a pathological fracture through the greater tuberosity of the humerus and also probably through the upper humeral shaft. Appearances are associated with a large soft tissue mass. The X-ray appearances are those of a large osteosarcoma in the humerus.

Radiological Report : XR Cervical Spine :

There is a very dense sclerotic appearance of C1 vertebral body. The rest of the cervical spine looks normal. The region of C1 should be included in the staging of this patient for her humeral tumour.

Radiological Report : XR Chest :

No metastases are identified from the right humeral sarcoma. Nevertheless the CT chest is recommended for staging.
